INSIGHTS & STORYTELLING

Mutual Fund Overview & Insights | Simple findings from the Python results and Power BI dashboard

1. Which fund type holds the largest total AUM? By roughly how much does it lead?

Equity has the largest total AUM among the categories in the dataset: **13,54,231.74 crore**. Debt comes next at **11,79,876.00 crore**. Equity leads Debt by approximately **1,74,355.74 crore** (about 1.74 lakh crore).

Note: The dataset uses a *category* column, not a separate fund-type column, so this answer compares categories.

2. Which fund manager manages the highest total AUM?

Rahul Goswami has the highest combined AUM in the supplied results, at **1,31,306 crore** across schemes associated with this manager.

3. Which fund type or strategy has the lowest expense ratio? What is it?

Among the main categories, **Debt** has the lowest average expense ratio at **0.358%** (about 0.36%). Lower expenses mean a smaller share of the fund is used to cover costs. The provided output compares categories; it does not show the lowest sub-category or strategy.

4. Which scheme delivered the best 1-year return, and what was it?

Bank of India Credit Risk Fund recorded the highest 1-year return at **130.80%**. Its other recorded figures include a 3-year return of 12.80%, a 5-year return of -4.10%, standard deviation of 77.72 and beta of -31.86. These unusual figures should be checked. A very high one-year return alone does not make a fund the best choice.

5. What is the average SIP amount and the typical minimum lump-sum across the funds?

Measure	Result
Average minimum SIP	528.50
Typical minimum SIP (median)	500
Average minimum lump-sum	3,047.47
Typical minimum lump-sum (median)	5,000

The average minimum SIP is about 529, while the median is 500. For lump-sum amounts, 5,000 is the median and better represents the middle scheme than the average, which can be affected by unusually low minimum amounts.

6. Compare 3-year returns across Equity, Hybrid and Debt. What is the return-versus-risktrade-off?

Category	Avg. 3-year return	Avg. risk level	Avg. standard deviation
Equity	29.74%	5.94	16.96
Hybrid	15.27%	4.16	7.49
Debt	6.23%	2.43	2.09

Simple explanation: Equity has the highest average 3-year return, but also the highest average risk level and standard deviation. Hybrid is in the middle, while Debt has lower average returns and lower recorded volatility. This shows a trade-off between historical return and how much returns can vary. Past results do not guarantee future performance.

7. Three short insight cards

Insight 1 — Equity leads in AUM

Equity schemes hold about 13.54 lakh crore in this dataset, around 1.74 lakh crore more than Debt schemes.

Insight 2 — SIPs can start around 500

The median minimum SIP is 500. This suggests that many schemes have relatively accessible starting amounts, although costs and risk still matter.

Insight 3 — Higher returns can mean higher variability

Equity has the highest average 3-year return at 29.74%, but also higher recorded risk and volatility than Hybrid and Debt.

Final Conclusion

This project analyzed 814 mutual fund schemes through data cleaning, statistical analysis, normalization, scoring, ranking, Excel reporting and Power BI visualization. The findings show that funds should not be judged by one number alone. Returns, expenses and risk all help provide a clearer picture. The ranking reflects the scoring rules used in this project and is an analysis exercise, not personalized investment advice.
